

GradCafe SQL Query Results

Question 1

How many entries are in the database for Fall 2026?

Answer: 21,424

Query description:

I used COUNT(*) to count rows in the applicants table and used a WHERE clause to only include rows where term = 'Fall 2026'. This directly answers the question because the term field stores the application start term.

Question 2

What percentage of entries are from international students, excluding American and Other?

Answer: 45.95%

Query description:

This query uses COUNT(*) FILTER to count rows where us_or_international is not American, not Other, and not NULL. I divided that count by the total number of rows and multiplied by 100 to get a percentage. I used ROUND(..., 2) because the assignment asks for the answer to two decimal places.

Question 3

What is the average GPA, GRE Quant, GRE Verbal, and GRE Analytical Writing score of applicants who provided these metrics?

Answer:

Average GPA: 3.77

Average GRE Quant: 165.86

Average GRE Verbal: 160.70

Average GRE Analytical Writing: 4.14

Query description:

I used separate AVG() queries for GPA, GRE Quant, GRE Verbal, and GRE Analytical Writing. Each query includes a WHERE clause checking that the field is not NULL, because applicants who did not provide a value should not affect the average. I rounded each average to two decimal places so the results are easier to read.

Question 4

What is the average GPA of American students in Fall 2026?

Answer: 3.78

Query description:

This query uses AVG(gpa) and filters to records where term = 'Fall 2026', us_or_international ILIKE 'American', and GPA is not NULL. I used ILIKE for the student type field so the match is not affected by capitalization.

Question 5

What percent of entries for Fall 2026 are acceptances?

Answer: 38.10%

Query description:

This query first filters the table to Fall 2026 entries. Within those rows, it uses COUNT(*) FILTER to count statuses containing "accept," then divides by the total Fall 2026 count and multiplies by 100. I used ILIKE '%accept%' because the status values come from scraped text, so flexible matching is safer than assuming every accepted record is formatted exactly the same way.

Question 6

What is the average GPA of applicants who applied for Fall 2026 and were accepted?

Answer: 3.75

Query description:

This query calculates AVG(gpa) for rows where the term is Fall 2026, the status contains "accept," and GPA is not NULL. This gives the average GPA only among accepted Fall 2026 applicants who reported GPA.

Question 7

How many entries are from applicants who applied to JHU for a master's degree in Computer Science?

Answer: 6

Query description:

This query uses COUNT(*) and filters for master's degree records, Computer Science in the program field, and either "Johns Hopkins" or "JHU" in the program field. I used ILIKE because the scraped program names are text fields and may have differences in capitalization or wording.

Question 8

How many entries from 2026 are acceptances from applicants who applied to Georgetown University, MIT, Stanford University, or Carnegie Mellon University for a PhD in Computer Science, using the downloaded fields?

Answer: 4

Query description:

This query uses the original downloaded program field. It filters for 2026 entries, accepted statuses, PhD records, Computer Science programs, and one of the four requested universities. I included multiple possible text matches such as “MIT,” “Massachusetts Institute of Technology,” “CMU,” and “Carnegie Mellon” because scraped school names are not always written the same way.

Question 9

Do the numbers for Question 8 change if using LLM-generated fields instead of downloaded fields?

Answer: 4

Query description:

This query repeats the same logic as Question 8, but instead of searching the original program field, it searches llm_generated_program for Computer Science and llm_generated_university for the requested schools. The count stayed the same in my database, which means the downloaded and LLM-generated fields gave the same result for this specific filter.

Question 10

My question: What is the average GPA for PhD applicants?

Answer: 3.80

Query description:

For my first original question, I used AVG(gpa) on records where the degree field contains “PhD” and GPA is not NULL. I chose this because I wanted to compare the GPA profile of PhD applicants against the overall applicant pool.

Question 11

My question: How many Fall 2026 entries are waitlisted?

Answer: 2,116

Query description:

For my second original question, I used COUNT(*) and filtered for term = 'Fall 2026' and statuses containing “wait.” I chose this because waitlisted applicants are a useful middle group between

acceptances and rejections, and I wanted to see how many waitlist records appeared in the Fall 2026 data.
