Hi, I'm Jonah Thomas.

Signal Processing Engineer at Johns Hopkins Applied Physics Laboratory

I am a Signal Processing Engineer at Johns Hopkins Applied Physics Laboratory (APL), currently participating in the Discovery Program, a rotational initiative designed to develop future technical leaders across complex national security, space, defense, healthcare, cyber, and applied research problem spaces.

My background spans statistical and analytical signal processing, navigation systems, hardware design, and system-level testing, giving me a strong foundation in both the theory and implementation of sensing, estimation, and autonomous systems.

I am particularly interested in the intersection of guidance, navigation, and control; perception; applied machine learning; and sensor fusion, especially as artificial intelligence becomes increasingly integrated into physical systems across defense, aerospace, autonomy, robotics, and intelligent platforms.

Projects

Module 1: Personal Developer Website

This project is a personal developer website built with Flask, HTML, and CSS. The site includes a homepage, projects page, and contact page. It demonstrates basic web development concepts, Flask routing, reusable HTML templates, CSS styling, and GitHub-based version control.

The website will be updated throughout the course as additional Python projects are completed.
